**Introduction :** The various congenital or acquired types of of vascular lesions are very common cosmetic problem on the face - vascular naevi, angiomas, cherry angiomas, spider naevi, venous lakes ...

**Methods:** We treated our patients with Pulsed Dye laser /PDL/, wavelength 595 nm with Dynamic Cooling Device/DCD/ and 1064 nm short pulsed ND Yag laser, depending on the skin type . In some cases both lasers can be combined in the same treatment. All results I present are after one treatment .

**Results:** Mild to moderate purpura developed immediately after the treatment and lasted for 7-10 days.

**Conclusion:** Lasers are powerful and useful devices for treatment of the facial vascular leasons for most skin types .
