**Background:** The basal cell nevus syndrome, also known as Gorlin-Goltz syndrome, is an autosomal dominant disorder that occurs with the development of basal cell carcinomas and other clinical and radiologic findings like odontogenic keratocysts, palmar and plantar pits, calcification of de falx cerebri and skeletal malformations. Medulloblastoma and other tumors can also be found. The point of this report is that the early diagnosis, appropriate treatments and secondary prevention are decisive to improve the patient's life.

**Observation:** In the present case, the authors describe an adult patient with multiple basal cell carcinomas having spread through the body over 15 years.

**Key message:** Gorlin-Goltz Syndrome; basal cell carcinoma; basal cell nevus syndrome; basal cell; odontogenic cyst;
